

COURSE MANAGEMENT

Aim towards the middle of greens and play away from trouble. Your shots have natural dispersion, so simplifying targets and removing danger from one side will almost always improve scoring.

DISTANCE CONTROL

Getting back on the course regularly will improve your understanding of how far the ball actually carries. Several good strikes today finished the wrong distance — that is a distance-awareness issue, not a strike issue.

AROUND THE GREENS

Pay close attention to landing points and slopes. Several chip shots ran further than expected because the landing zone was downhill. In those situations a lower-running shot is often safer than a high, precise chip to the edge of the green.

FULL SWING — KEY POINTS

- Start with hands slightly further forward at address
- Keep more weight forwards at setup
- Reduce body movement down and to the right during the swing
- Feel more compression through the strike
- Ball-then-ground contact, not ground-then-ball

UNDERSTANDING SLOPES & BALL FLIGHT

The same way a ball rolls on a slope is generally the effect that slope has on direction. When the ball is above your feet, the shot will naturally tend to move more left. Counter this by gripping shorter, aiming slightly right, and taking more club with a softer swing.

GRIP SHORTER

Choke down on the club to gain control. This also reduces distance slightly, which is fine — you are taking more club.

AIM RIGHT

Allow for the natural left curve. Aim a little further right at address so the ball finishes on target.

MORE CLUB, SOFTER SWING

Take one extra club and make a controlled, comfortable swing rather than forcing full speed.

SUMMARY

There were a lot of positive signs today. The main improvements will come from simplifying decisions on the course, understanding carry distances better, and improving strike consistency. A full-swing video follows with more detail on technique.
